

ABSTRACT

Sub C1
\$8

A device for the measurement and analysis of body fluids, or for measuring periods of time, includes a clock and a measuring module with the measuring module including a data processing unit, a data input unit, and an indicator unit. When the measuring module and the clock are used in combination, the time indications provided by the clock are obtainable by the measuring module and can be used for various purposes depending on the functions to be carried out by the measuring module. The measuring module can also have contacts for connection with an external device to allow exchange of data between the measuring module and the external device.
